

Modelling Mobility Service Provision

iCity-CATTS Symposium:
TRANSFORMATIVE TRANSPORTATION 2020
June 3, 2020

Francisco Calderón, PhD Candidate
Eric J. Miller, PhD
Department of Civil & Mineral Engineering
University of Toronto

The Advent of Mobility Services

- Rapidly growing
- Broad range of service offerings

Pros

Solutions to network problems?

- Vehicle ownership

+ Accessibility

+ Flexibility

Cons

+ "Empty" VKTs

Fair pricing? (surges)

+ Emissions (motorized)

+ Congestion (motorized)

Modelling challenges

- How much does each “factor” really weigh?
- Speculative timelines, narrowed-down modelling scenarios
- Ever-changing service features/offerings
- **What about large urban regions and multimodal transportation model systems?**
- *Agent-based microsimulation* offers a policy-sensitive planning tool to ask “what if” questions and test scenarios

Service Providers

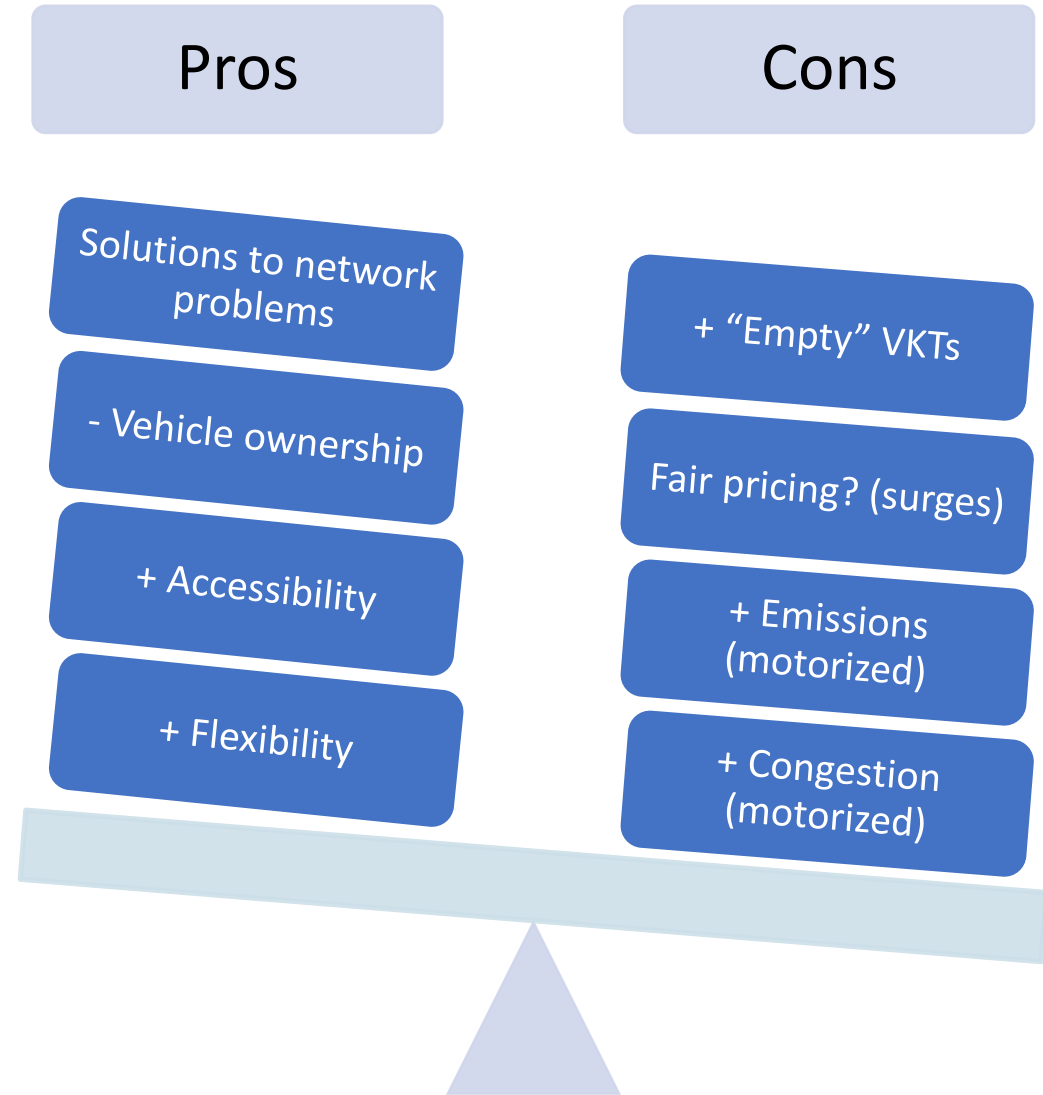

Vehicles

Users

Mobility Providers

The first building block

Key propositions:

- Over-attention to AVs can be counter-productive, modelling **driver activity** is essential
- Mobility as a Service paradigm: important to keep doors open for mobility services operating in isolation
- Complexity of emerging mobility services requires modelling of service provision
- **Operational activities are fairly generic among mobility service providers**
 - Matching (users & vehicles), Fleet Rebalancing, Dynamic Pricing

Modelling foundation: Conceptual Framework

Modelling Mobility Services: Towards a Supply-Centered Conceptual Framework

¹Calderón, F.F. & ^{1*}Miller, E.J.

* lead presenter, miller@ecf.utoronto.ca

¹ University of Toronto, Canada

- Conventional models cannot fully accommodate service provision:
 - How to account for dynamics? (pricing, tracking/managing vehicle fleet)
 - Where within our models would operational tasks “fit in”? (matching, rebalancing, etc.)
 - How to model driver activity?
- High flexibility and generality is required to address “volatility”

- Fully-developed framework under review in:

Transportation Letters
The International Journal of Transportation Research

Some fundamental principles

Separate Services from Networks

- Conventional models embed PT service concept within networks
 - Fixed schedules and alignments
- Practical, but no longer feasible

SERVICE PROVISION

Some fundamental principles

Encapsulation & Clear Interfaces

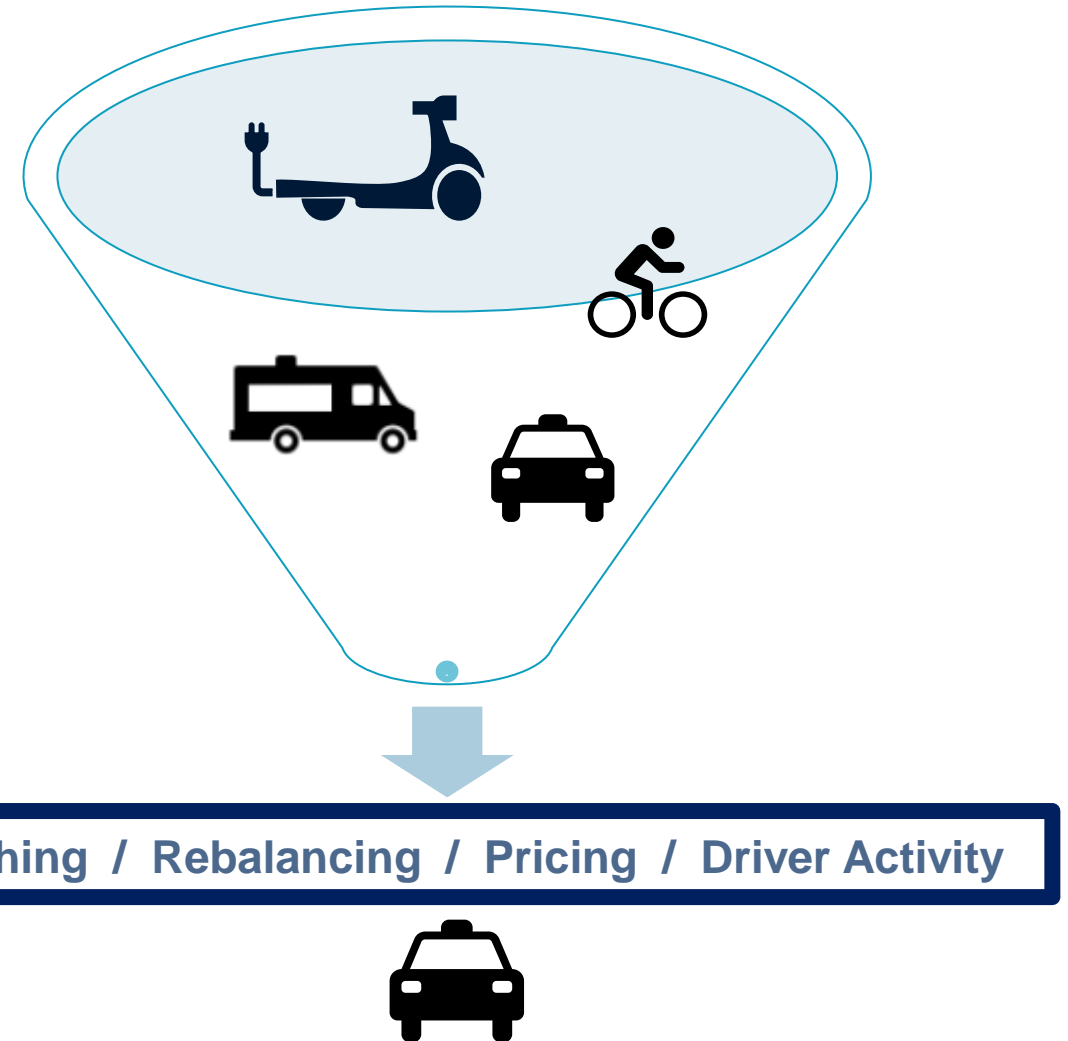

- Isolate components
- **Clearly defined interfaces** to interconnect components are critical to achieve model integration
 - Trips still are the basic unit of analysis (I/O for all components)

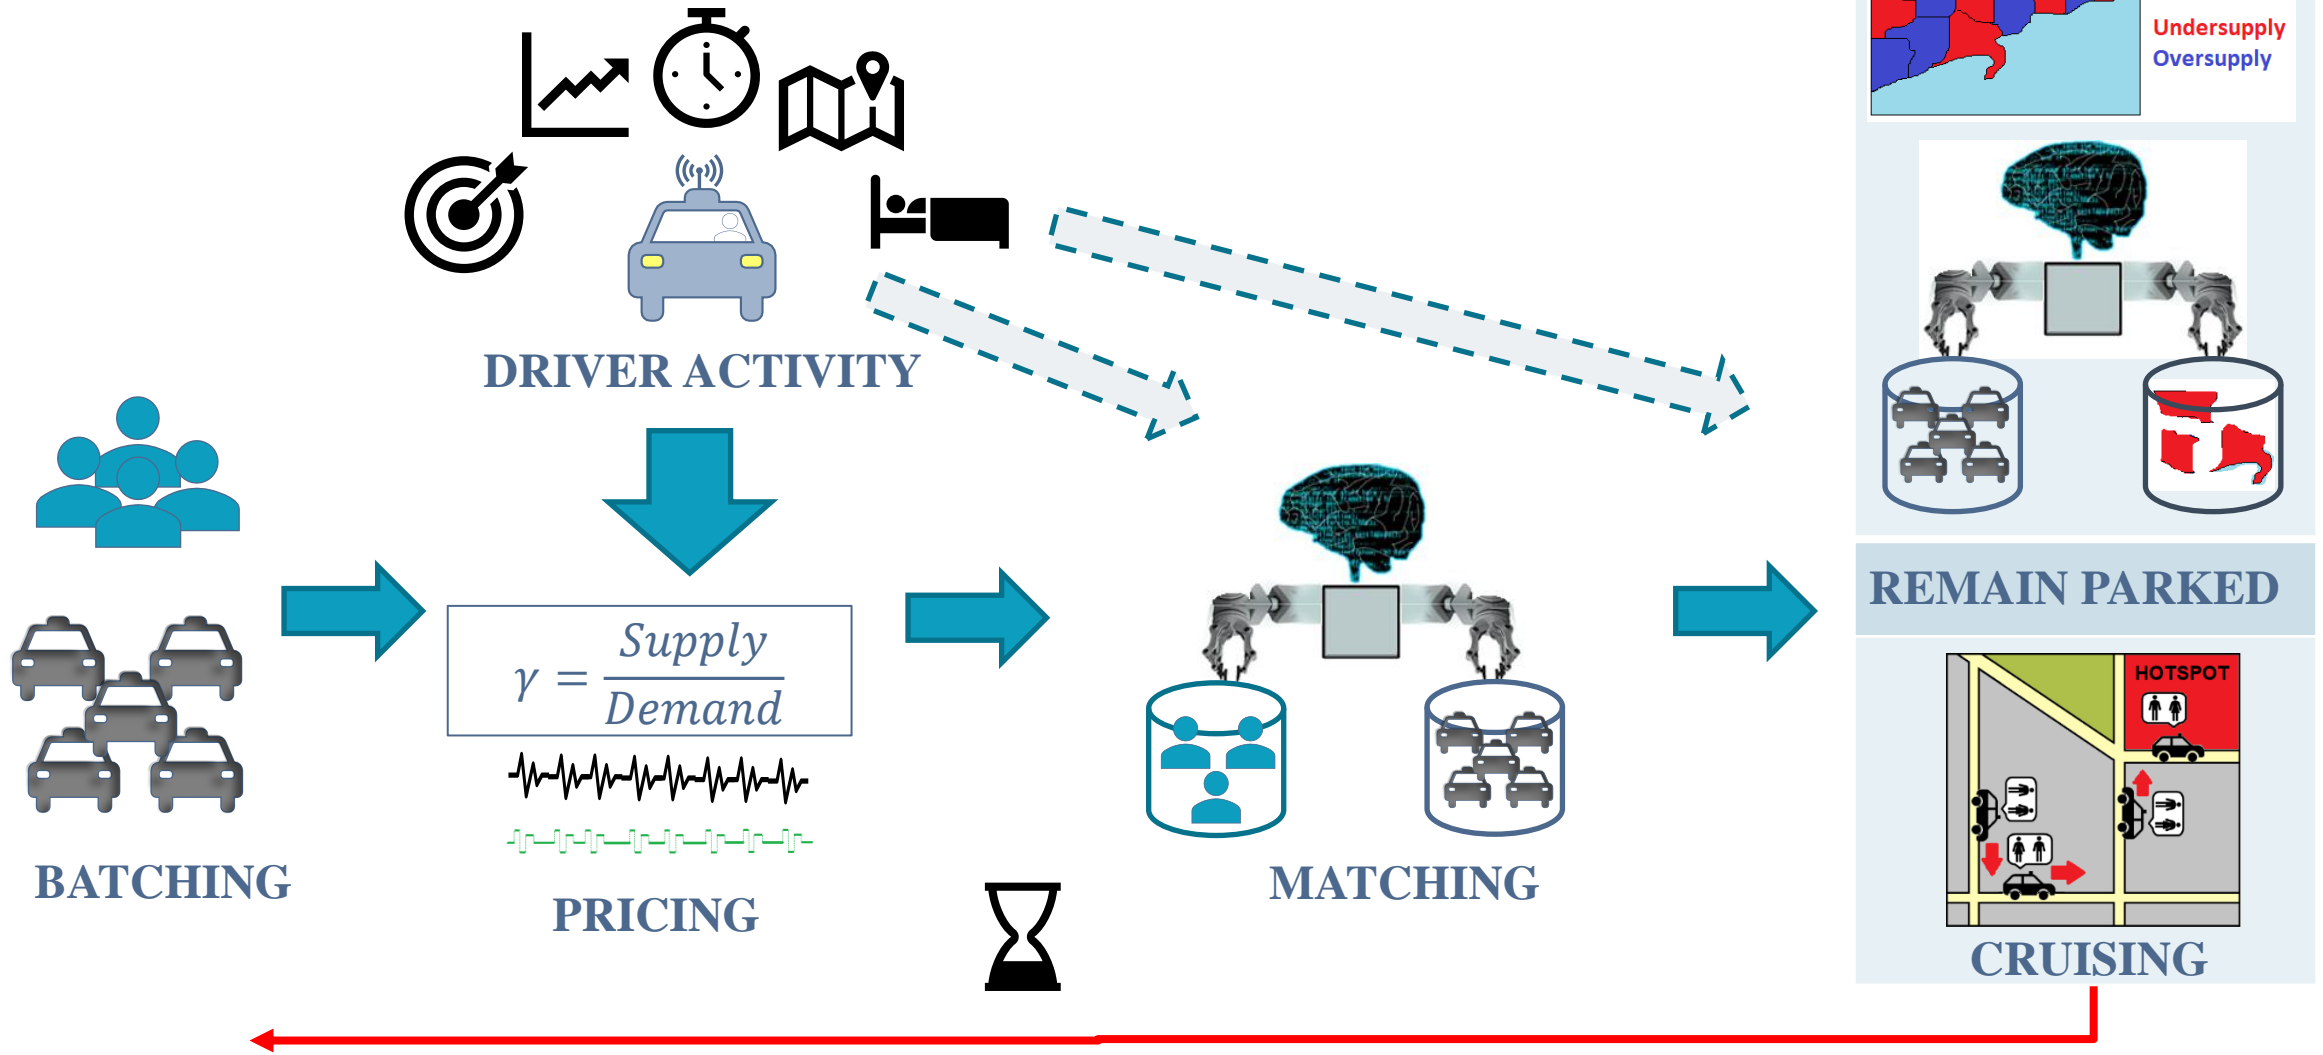

Some fundamental principles

Bottom-up approach

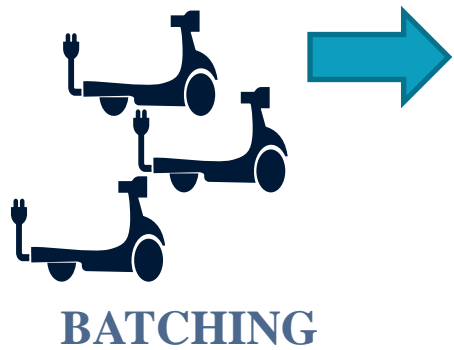

- Outline generic service provision process with ridehailing (most representative case in terms of operational activities)
- Several other services can be represented by one or more activities
 - At most, minor modifications to the service provision process thanks to generic tasks

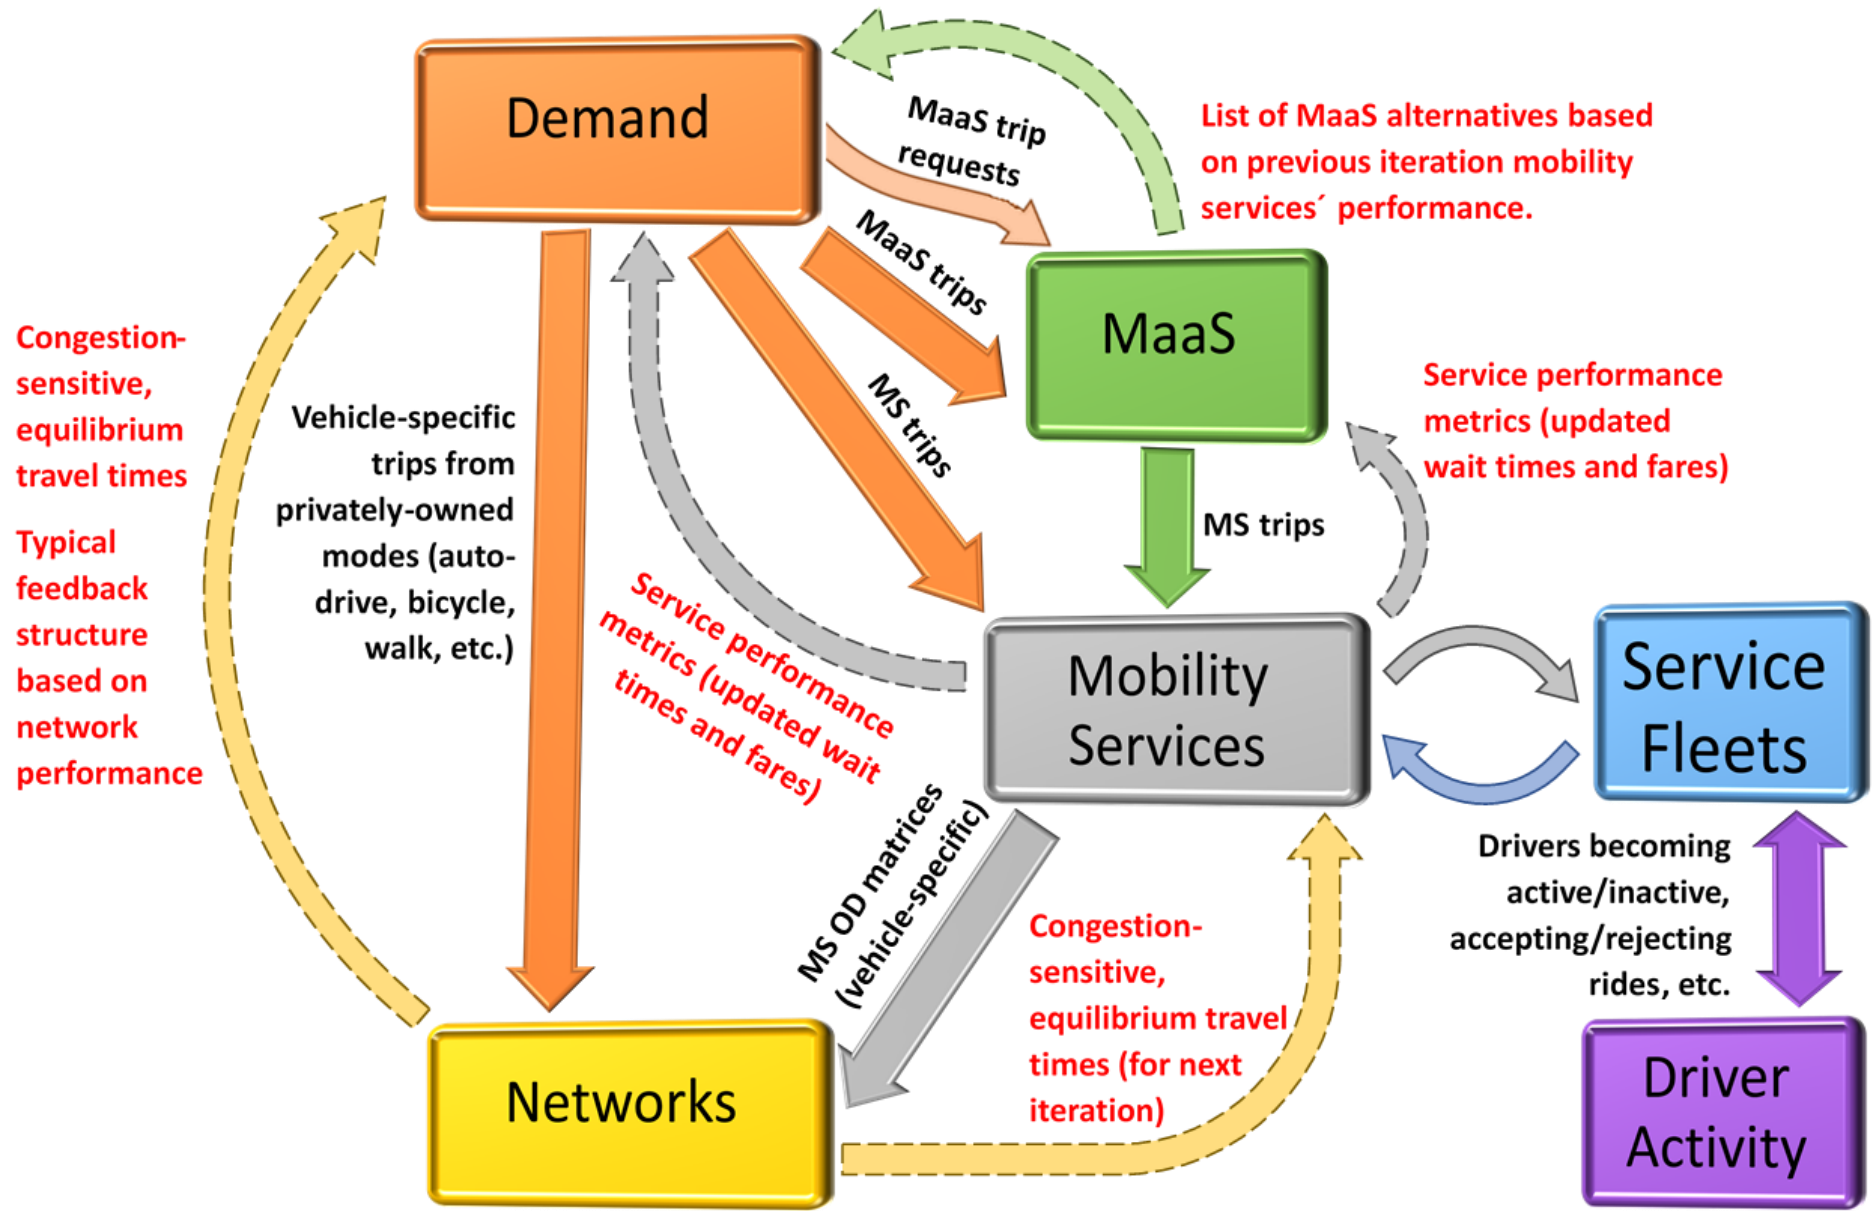

Generic Service Provision Process

Generic Service Provision Process

Putting all the pieces together

The Ridehailing use case

Limited data and operational knowledge!

- TTS 2016 included ridehailing for the first time
 - Sample size not enough for modelling service provision
- Vehicle For Hire Bylaw Review Project with the City of Toronto
 - Big data, but still only demand (realized trip records)

Procedia Computer Science
Volume 151, 2019, Pages 745-750

A new outlook on ridehailing: spatiotemporal patterns and commuting analysis from the Greater Toronto and Hamilton Area

First-Order Models of Ridehailing Service Provision

- “A *Prototype Model of Ridehailing Service Provision*” presented at:

- “*Modelling Within-Day Ridehailing Service Provision with Limited Data*” Forthcoming in:

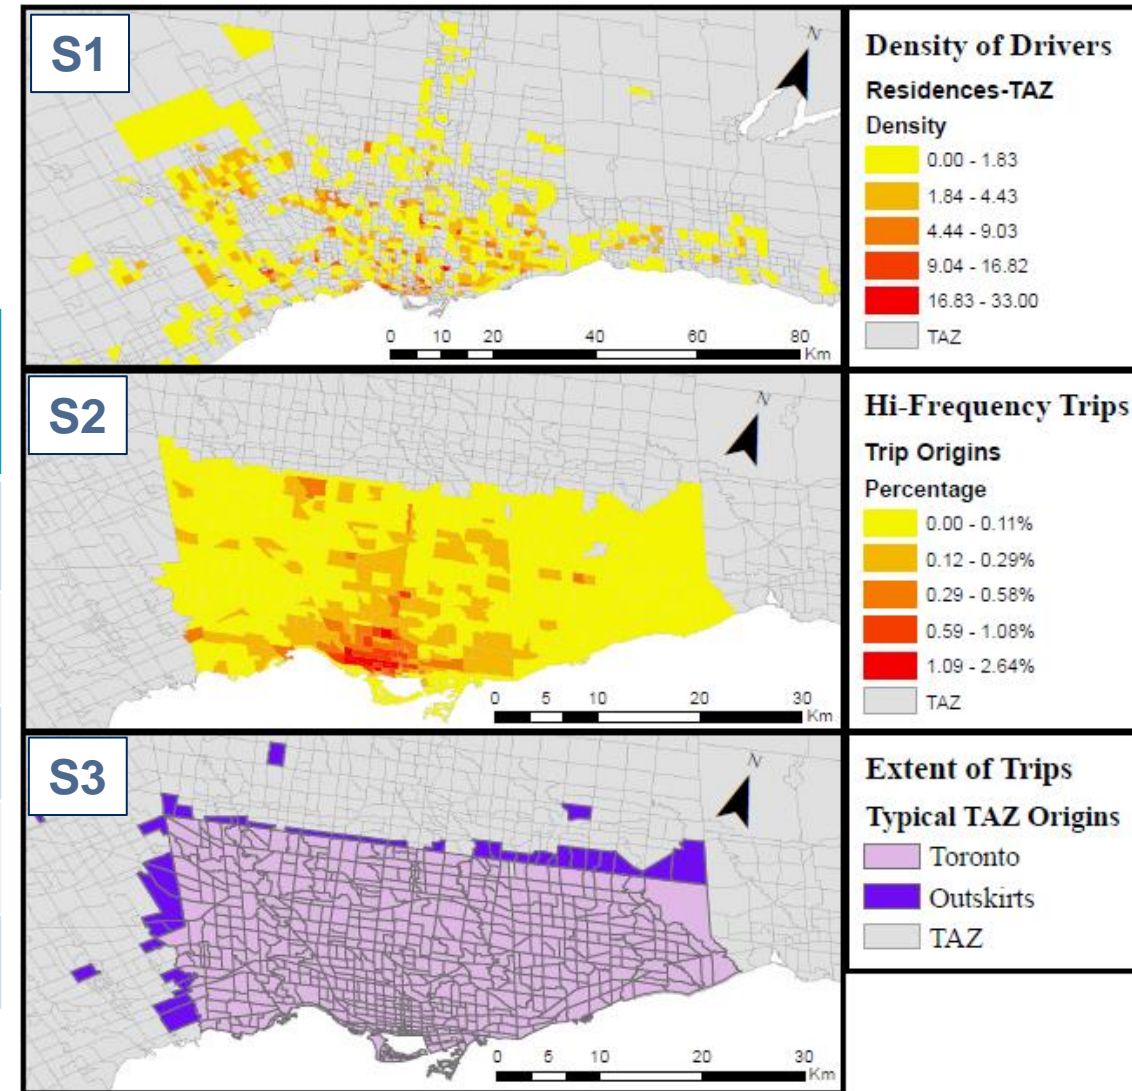

First-Order Models of Ridehailing Service Provision

Driver Activity:

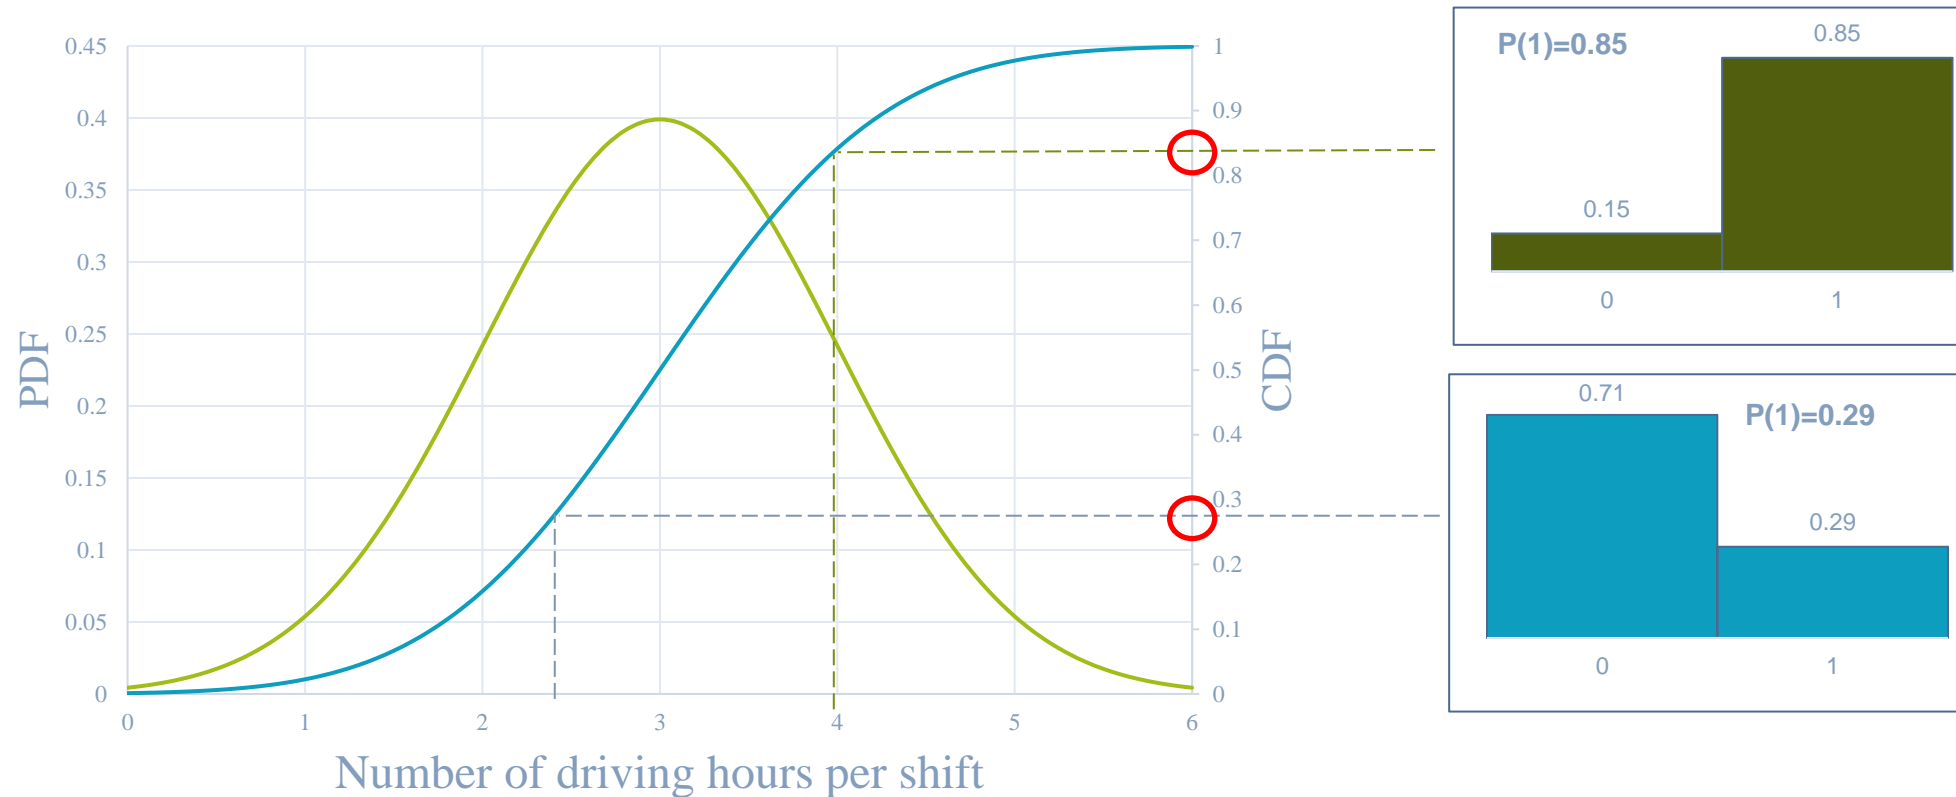

Vehicle location generation

Time Period	Special Demand Patterns?	1st SHIFT	>1 SHIFTS
AM (6-9)	Commute Outskirts	Strategy 1	Strategy 1
MD (9-15)	CBD and business	Strategy 2	Strategy 3
PM (15-19)	Normal	Strategy 3	Strategy 2
EV (19-24)	Entertainment	Strategy 1	Strategy 2
ON (24-6)	Return home	Strategy 2	Strategy 2

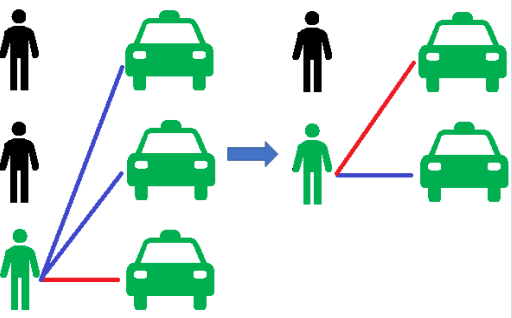

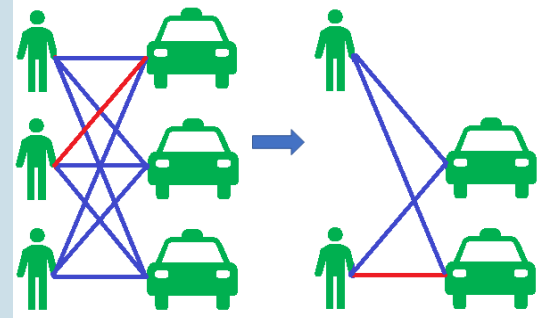

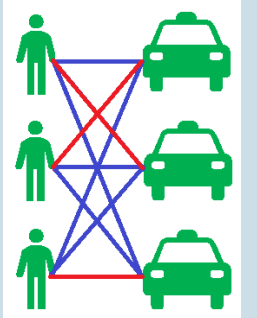

First-Order Models of Ridehailing Service Provision

Driver Activity: vehicles leaving the system

First-Order Models of Ridehailing Service Provision

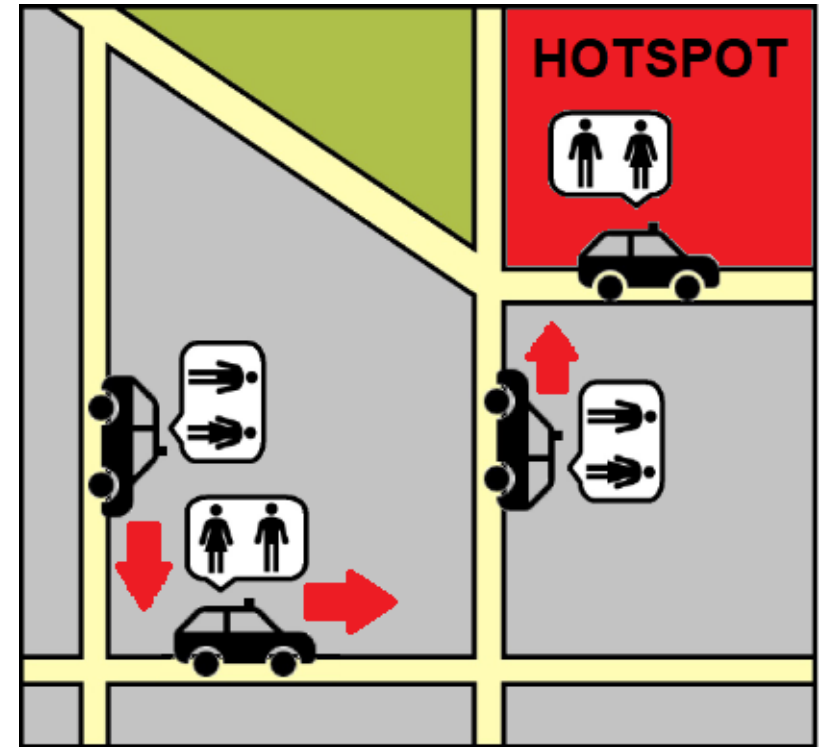

Matching algorithms

Greedy	Centralized Greedy	Hungarian
 The diagram shows three users (black and green icons) and three vehicles (green car icons). Blue lines represent potential matches. A red line indicates the chosen match between the bottom user and the rightmost vehicle. An arrow points to the next step where the top user is matched with the middle vehicle.	 The diagram shows three users and three vehicles. Blue lines represent all possible matches between users and vehicles. A red line indicates the chosen match between the top user and the middle vehicle. An arrow points to the next step where the middle user is matched with the rightmost vehicle.	 The diagram shows three users and three vehicles. Blue lines represent all possible matches between users and vehicles. A red line indicates the chosen match between the top user and the middle vehicle. An arrow points to the next step where the middle user is matched with the rightmost vehicle.
<p>Closest distance from one random user to all available vehicles. Sequential, one match at a time. Random order of matches yields non-optimal outcomes</p>	<p>Closest distance from any user to any vehicle, but still sequential, one match at a time. Order is now deterministic, yet still yields non-optimal outcomes</p>	<p>Every possible match and matching order assessed simultaneously. This is an optimal assignment.</p>

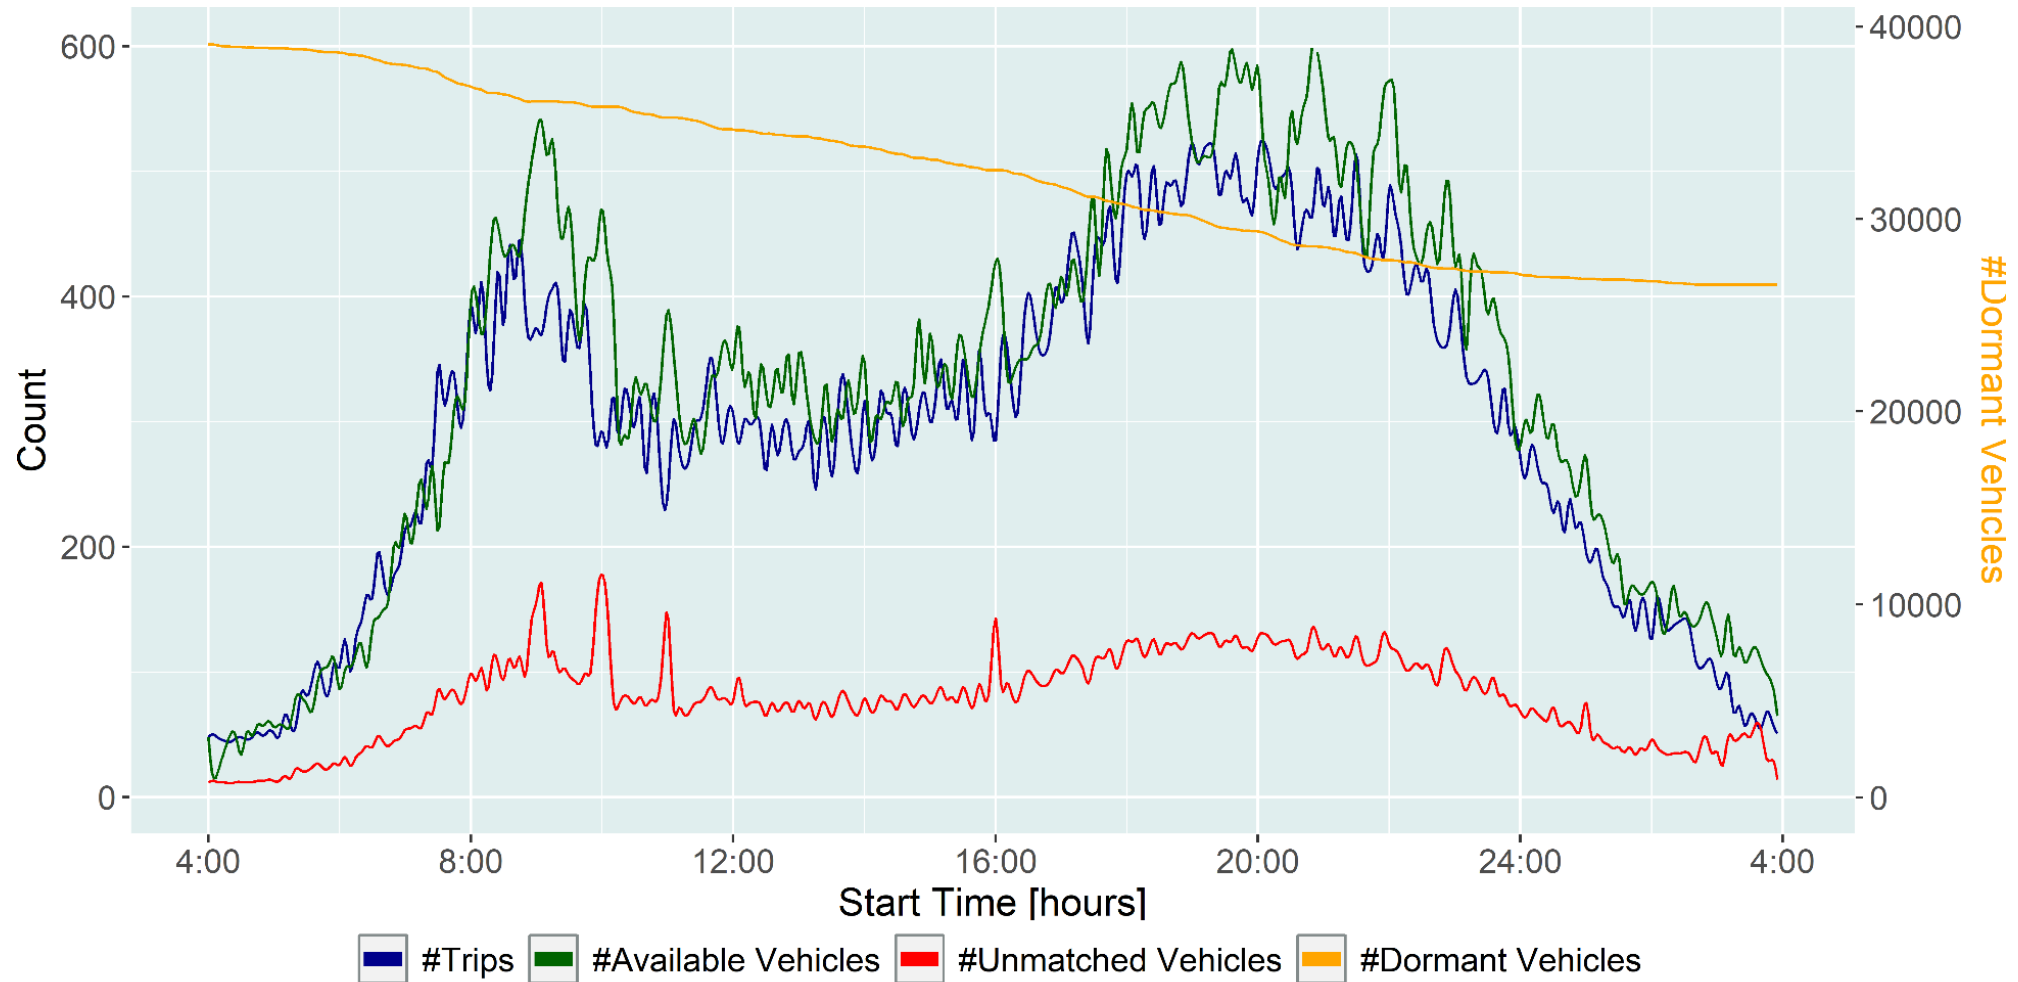

First-Order Models of Ridehailing Service Provision

Cruising

- High uncertainty due to lack of data and evidence
 - Research suggests that ridehailing drivers are expected to park to a larger extent than taxis (Xu, Yin, and Zha 2017).
- **Assumed:** every time interval, 70% of *idle* drivers relocate to their nearest high-demand zone (top-30% ranked from historical demand)

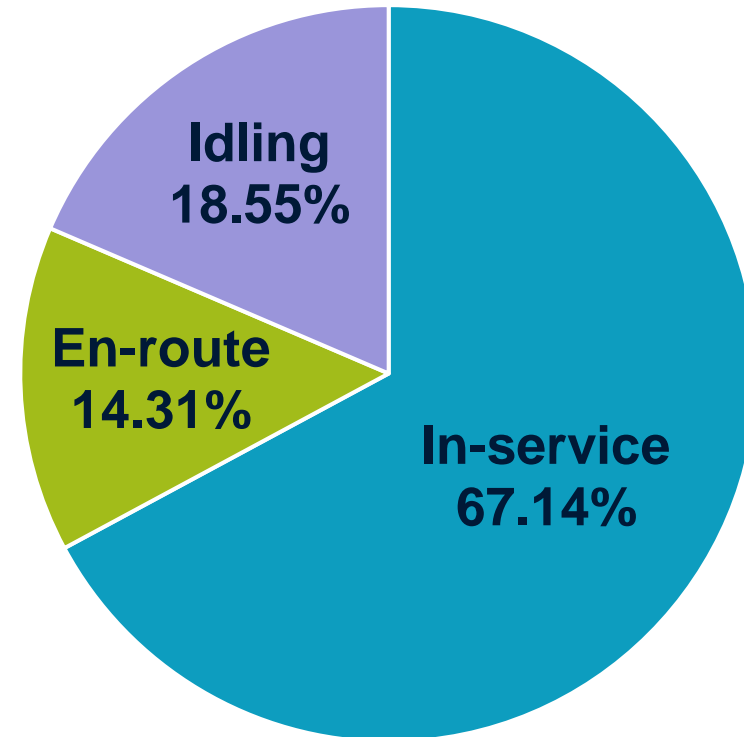

Model Outputs: Overall System Metrics

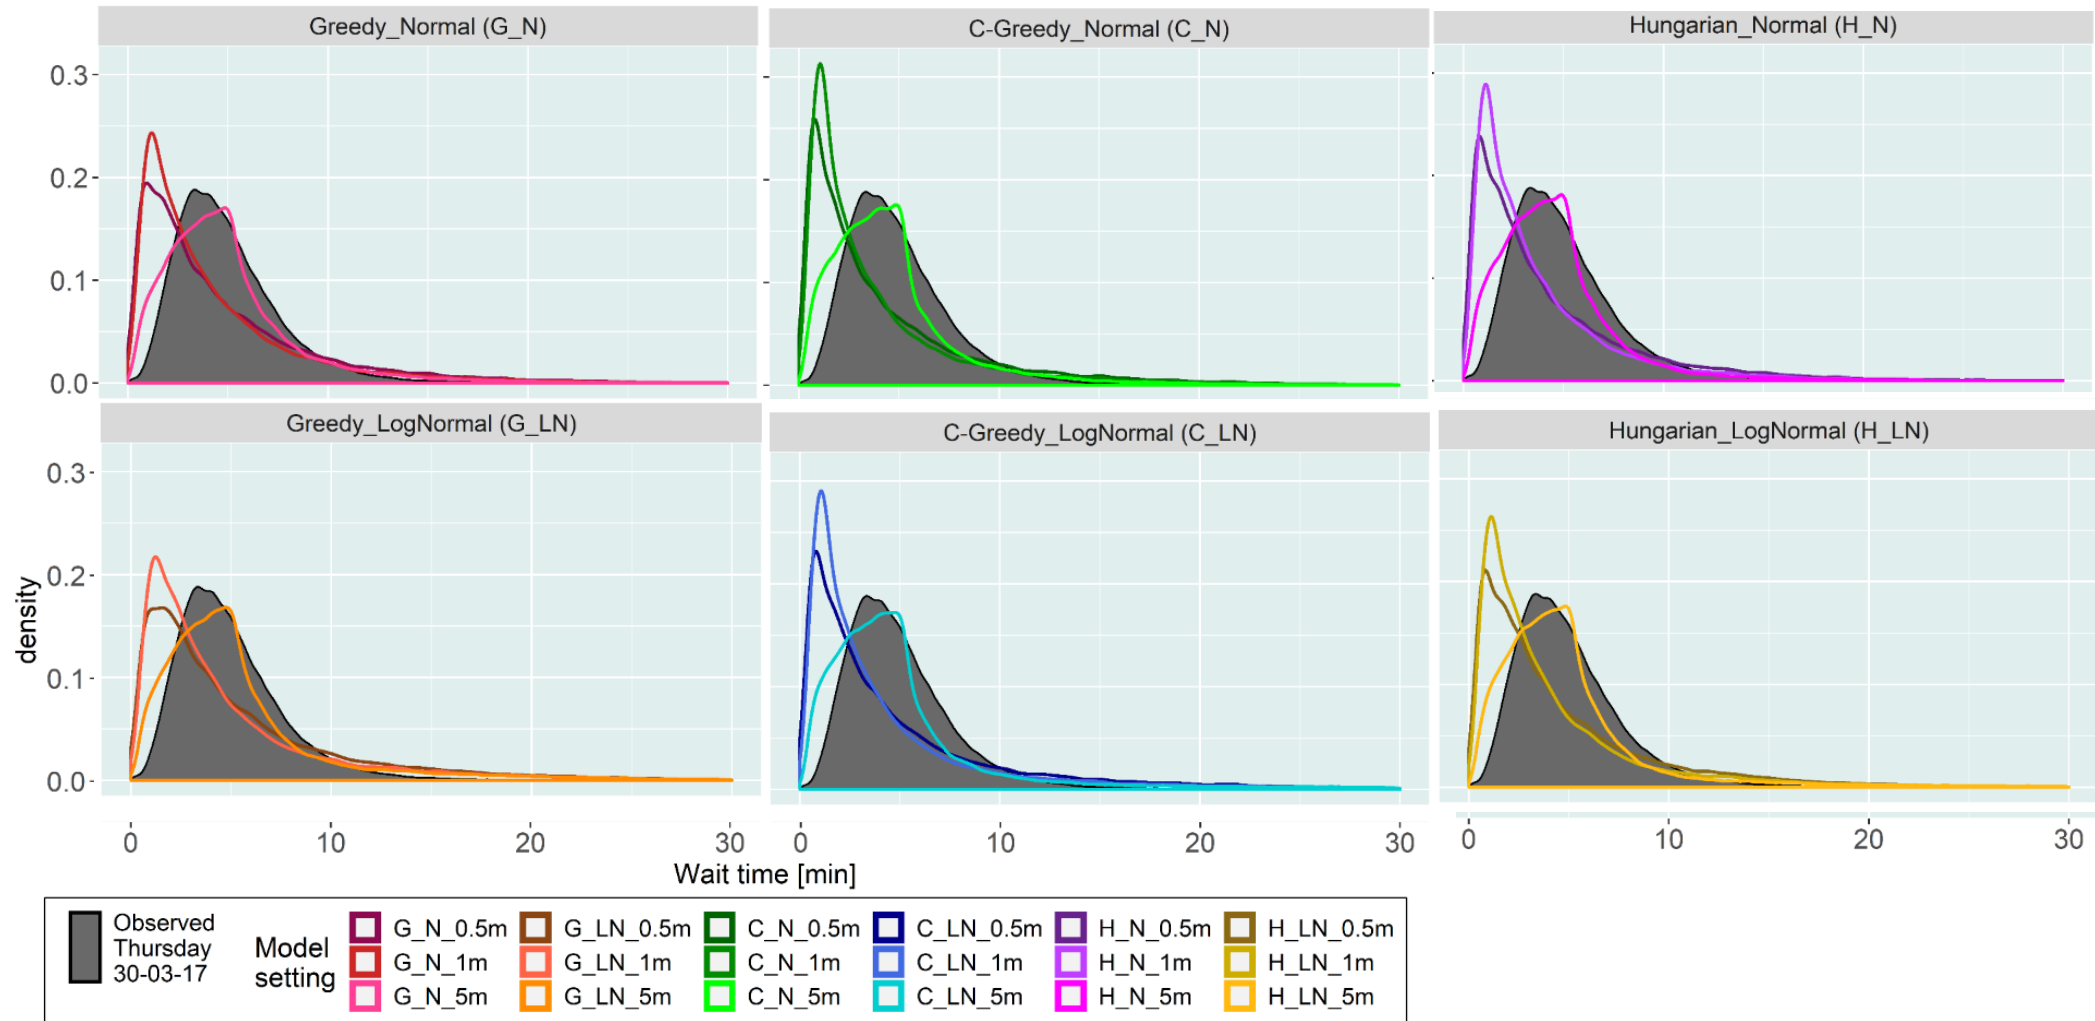

Model Outputs: VKT Breakdown

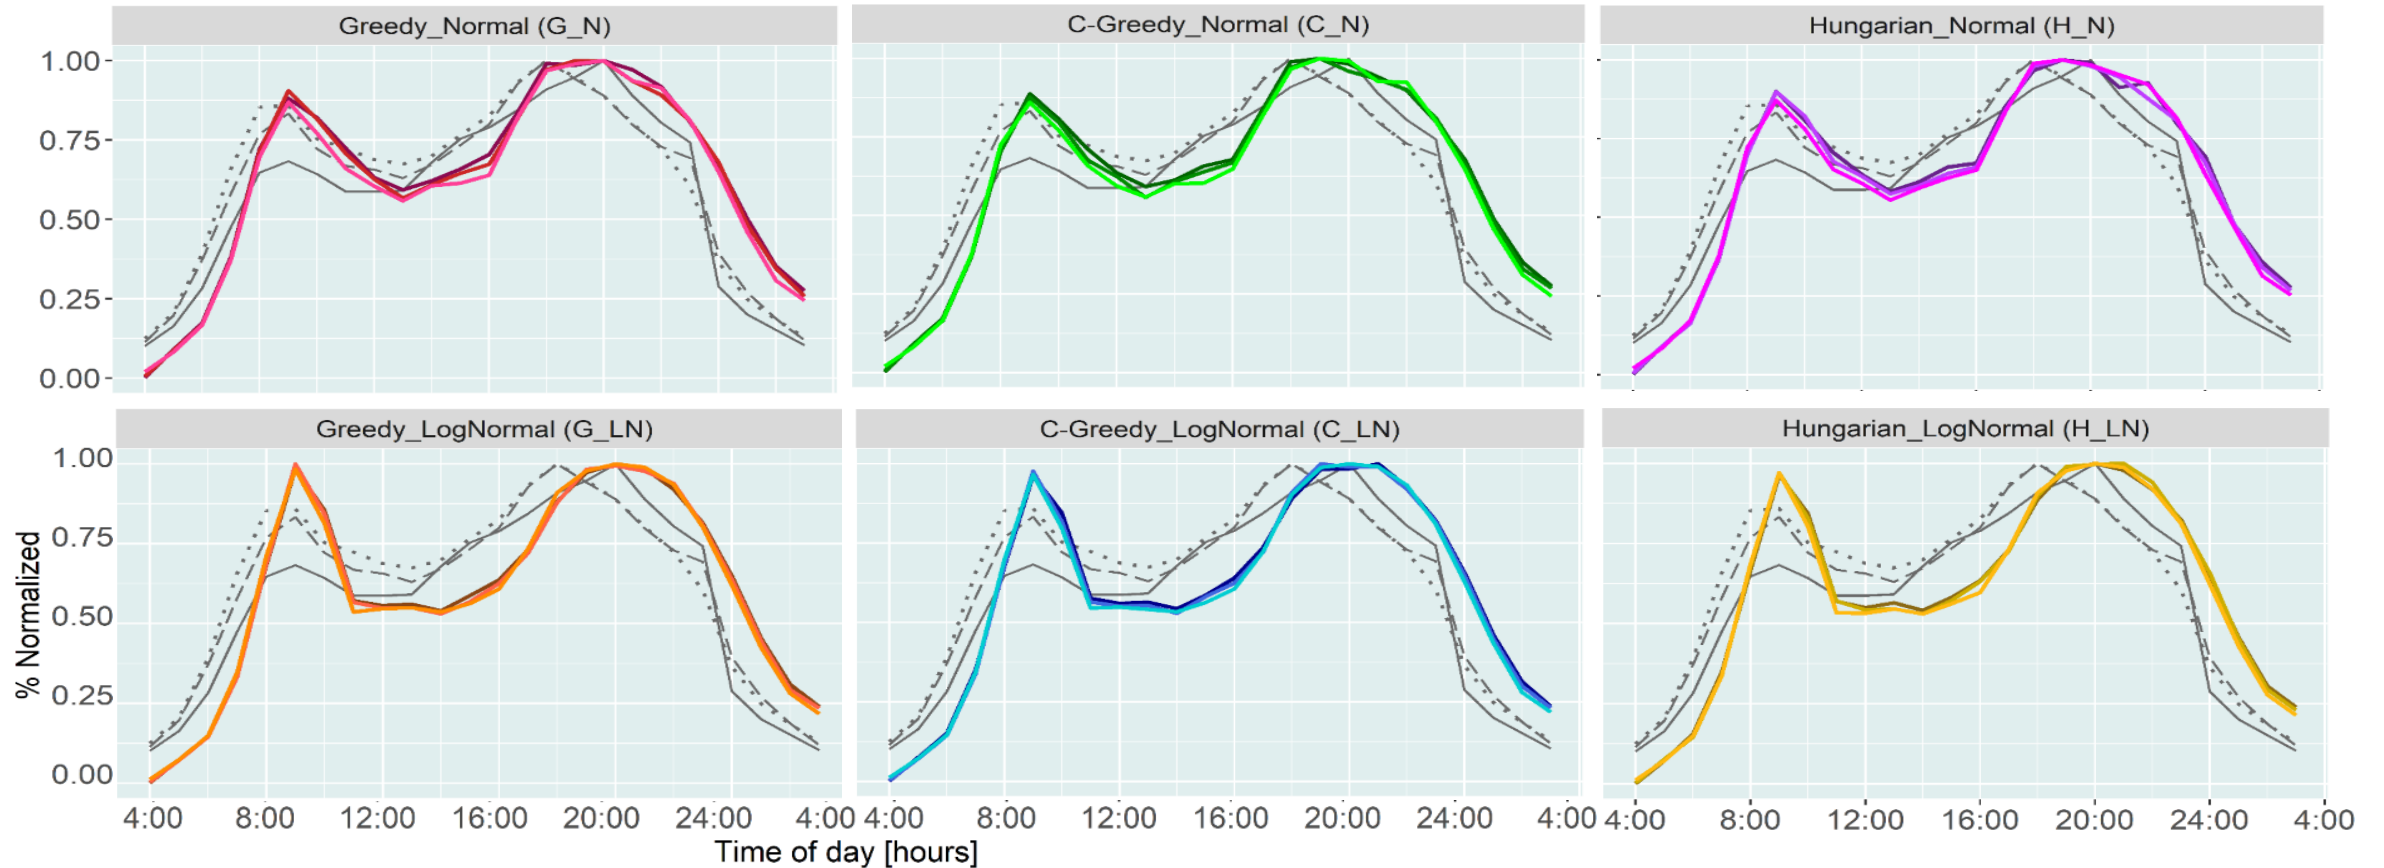

- Key metric for policy analyses of negative externalities, and to assess operational performance:
 - VKT by state.
 - Time by state.
 - Efficiency of service provision implicit in “state split”.

Performance Against Wait Time Distribution

Performance Against Unique Drivers per Hour

Towards a full-blown model: Data mining

- **Next steps:** formal driver activity modelling and more elaborate representations of service providers' operational activities
- Richer dataset required
 - RideAustin: much smaller sample, **but** it includes driver IDs and en-route variables

Data mining: matching application

Infer vehicle locations

In-depth matching analyses (to be published)

- Impacts of algorithm, time step, overall problem size and unmatched agents
- Performance metrics considered include en-route VKT and computation times.
- Trade-offs among time interval, computation time, and degree of optimality.

Data mining: matching application

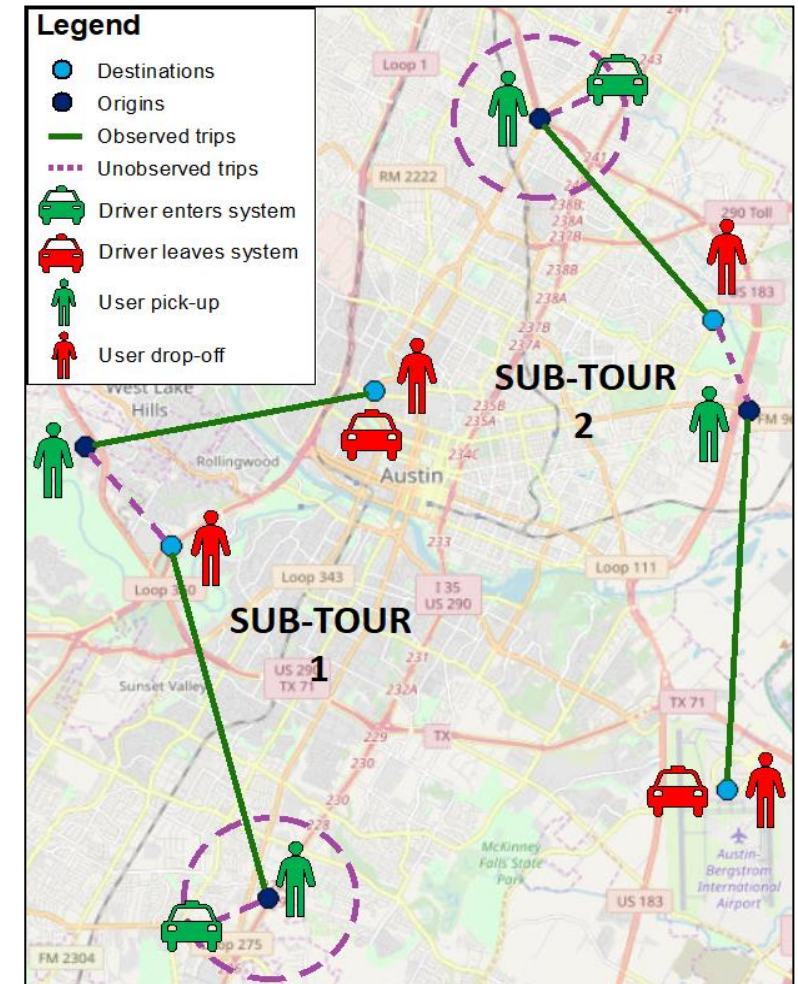

Data mining: driver activity application

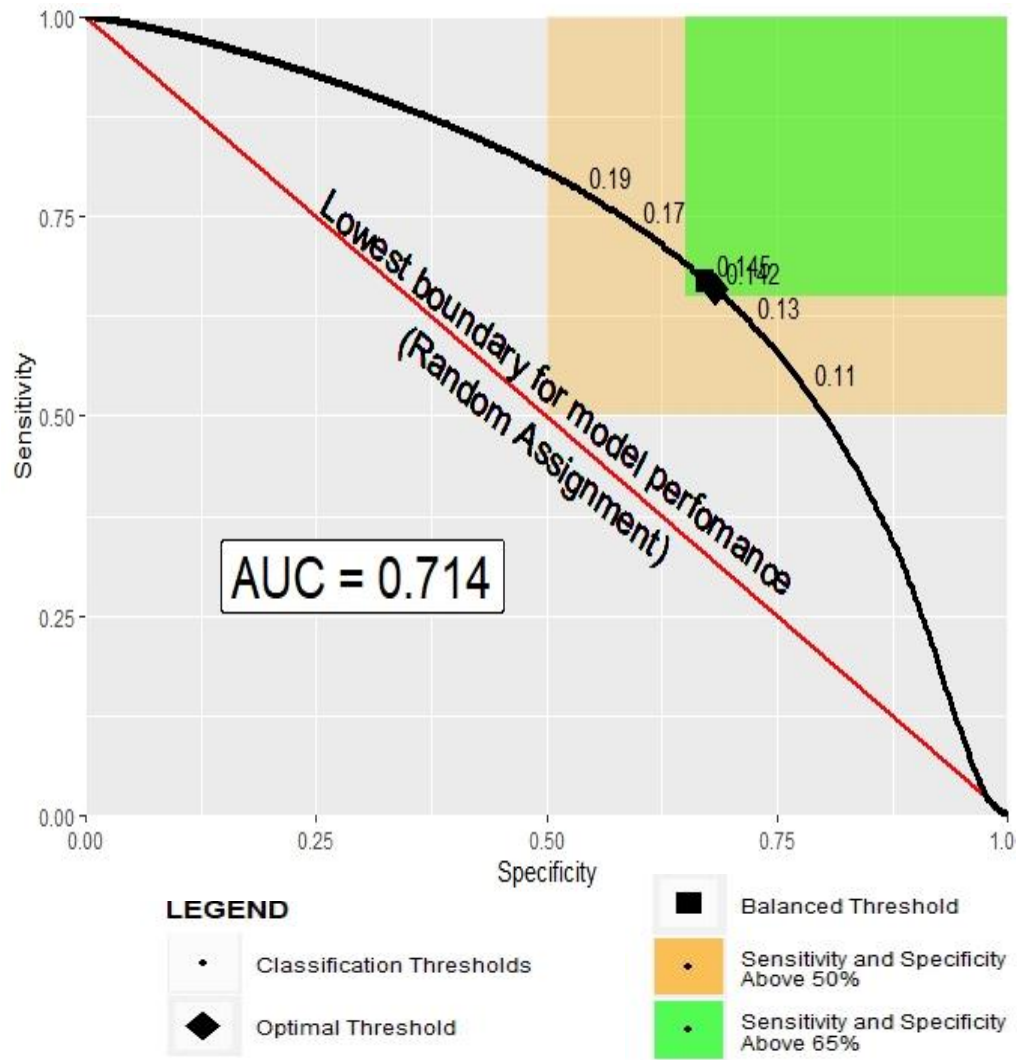

Generate driver activity logs

- Critical data input for **driver activity** modelling
- Hazard/Logit models for drivers' decisions/time to: enter and leave the system (to be published). Depend on several system-level and agent-level variables.

Data mining: driver activity application

Data mining: rebalancing first steps

Identify potential rebalancing trips

- **Idle time:** e.g. >15 and <60 minutes
- **En-route speed:** e.g. >15 Km/h
- **Subsequent trip attributes:**
 - **Distance:** e.g. >8 Km
 - **Originates at a “hotspot”?**
- Ground truth information/data about rebalancing is very scarce currently, realistic modelling is not yet possible. However...

Applications

- VKTs
- Emissions
- Congestion impacts
- Spatial analyses (equity and accessibility)
- Policy and regulation (test scenarios)
- Performance and operational assessment
- Impacts of emerging technologies (AVs and EVs)

Future Work

- Higher-order matching algorithms
 - “Pooled” services
 - Non-myopic mechanisms
 - Reassignment of matches
- “Migrating” public transit into the service provision component
- MaaS implementations
- Implement more emerging mobility services, likely starting with bikesharing and e-scooters.

Thank You!
